# Payment Channels Overview

## Orfeas Stefanos Thyfronitis Litos

University of Edinburgh o.thyfronitis@ed.ac.uk

**Abstract.** We provide a payment network functionality and prove that the Lightning Network [1] UC-realizes it.

## 1 State of a channel

Consider a channel between *Alice* and *Bob*. Both parties hold some data locally that correspond to ownership of some funds in the channel. Here we define a concise way of representing this data.

What Alice has to hold, specific for this channel:

- keys:
  - local funding secret key
  - remote funding public key
  - local {payment, htlc, delayed payment, revocation} basepoint secret
  - remote {payment, htlc, delayed\_payment, revocation}\_basepoint
  - seed (for local per\_commitment\_secrets)
  - remote per\_commitment\_secret $_{1,\dots,m-1}$
  - remote per\_commitment\_point $_{m,m+1}$
- Alice's coins
- Bob's coins
- every HTLC that is included in the latest irrevocably committed (local or remote) commitment:
  - direction (Alice  $\rightarrow Bob$  or  $Bob \rightarrow Alice$ )
  - hash
  - preimage (or ⊥ if still unresolved)
  - coins
  - Is it included in local commitment<sub>n</sub>?
  - HTLC number
- signatures:
  - signature of local commitment $_n$  with secret key corresponding to remote funding public key

• for every HTLC included in local commitment<sub>n</sub>, one signature of HTLC-Timeout if outgoing, HTLC-Success if incoming with secret key corresponding to remote htlc\_pubkey<sub>n</sub> (= htlc\_basepoint +  $\mathcal{H}$ (remote per\_commitment\_point<sub>n</sub> ||remote htlc\_basepoint) · G)

The rest of the things used in the protocol can be derived by the above.

Representation of a channel's state (from the point of view of Alice):

- Alice's coins  $c_{Alice}$
- Bob's coins  $c_{Bob}$
- list of (coins, state ∈ {proposed, committed}) preimage, whether we have a signature), HTLCs
  - negative coins are outgoing, positive are incoming
  - HTLCs can either be simply proposed (not in an irrevocably committed remote transaction) or committed (the opposite). After the preimage is supplied (no matter the direction), the HTLC is considered settled and is discarded.

```
I.e. State<sub>Alice,pchid</sub> = (c_{Alice}, c_{Bob}, ((c_1, \text{state}_1), \dots, (c_k, \text{state}_k)))
E.g. State<sub>Alice,pchid</sub> = (4, 5, ((0.1, \text{proposed}), (-0.2, \text{signed})))
```

We do not include in the state elements whose contents are irrelevant (e.g. sigs, keys, hashes).

#### 2 UC conventions

```
– send (READ) to \mathcal{G}_{Ledger} and assign reply to \Sigma ... = { send (READ) to \mathcal{G}_{Ledger} upon receiving delayed output \Sigma ... }
```

– every output that is returned by  $\mathcal{F}_{PayNet}$  or a player to  $\mathcal{E}$  is in fact a delayed output: It is handed over to  $\mathcal{A}$ , who in turn decides when to give it to  $\mathcal{E}$ .

### 3 Differences from LND

- They use an ad-hoc construction for generating progressive secrets from seed and index, we use a PRF.

_	(Related) To revoke, they send the previous secret (which is a secret key), we send the randomness generated by the PRF.
_	To generate several public keys from one piece of info, they use the basepoint and the per commitment point and take advantage of EC homomorphic properties. We use an Identity Based Signature scheme.
_	To generate the shared secret/public key, they use an ad-hoc scheme. We define a new primitive.

```
Protocol \Pi_{LN} (self is Alice always) - support
 1: Initialisation:
 2:
          \texttt{channels}, \texttt{pendingOpen}, \texttt{pendingPay}, \texttt{pendingClose} \leftarrow \emptyset
 3:
          \texttt{newChannels}, \texttt{closedChannels} \leftarrow \emptyset
          unclaimedOfferedHTLCs, unclaimedReceivedHTLCs, pendingGetPaid \leftarrow \emptyset
 4:
 5:
 6: Upon receiving (REGISTER, delay, relayDelay) from \mathcal{E}:
          \mathtt{delay} \leftarrow \mathrm{delay}
 7:
 8:
          relayDelay \leftarrow relayDelay
 9:
          send (READ) to \mathcal{G}_{Ledger} and assign largest block number to lastPoll
          (pk_{Alice}, sk_{Alice}) \leftarrow \text{KeyGen}()
          send (REGISTER, Alice, delay, relayDelay, pk_{Alice}) to \mathcal{E}
11:
12:
13: Upon receiving (REGISTERED) from \mathcal{E}:
14:
          send (READ) to \mathcal{G}_{\text{Ledger}} and assign reply to \Sigma_{Alice}
15:
          assign the sum of all output values that are exclusively spendable by Alice
     {\it to} on Chain Balance
16:
          send (REGISTERED) to {\cal E}
17:
18: Upon receiving any message (M) except for (REGISTER):
          if if haven't received (REGISTER) from \mathcal{E} then
19:
20:
               send (INVALID, M) to \mathcal{E} and ignore message
21:
          end if
22:
23: function GetKeys change font
24:
          (p_F, s_F) \leftarrow \text{KeyGen}() // \text{ For } F \text{ output}
25:
          (p_{\text{pay}}, s_{\text{pay}}) \leftarrow \text{MKeyGen}() // \text{For com output to remote}
          (p_{\text{dpay}}, s_{\text{dpay}}) \leftarrow \text{MKeyGen}() // \text{ For com output to self}
26:
          (p_{\mathrm{htlc}}, s_{\mathrm{htlc}}) \leftarrow \mathrm{MKeyGen}\,() // For htlc output to self
27:
          \mathtt{seed} \xleftarrow{\$} U(k) \mathrel{//} \mathsf{For per com point}
28:
          (p_{\text{rev}}, s_{\text{rev}}) \leftarrow \text{MKeyGen}() // \text{ For revocation in com}
29:
30:
          return ((p_F, s_F), (p_{\text{pay}}, s_{\text{pay}}), (p_{\text{dpay}}, s_{\text{dpay}}),
31:
               (p_{\text{htlc}}, s_{\text{htlc}}), seed, (p_{\text{rev}}, s_{\text{rev}}))
32: end function
```

```
Protocol \Pi_{\mathrm{LN}} - OpenChannel from \mathcal E
1: Upon receiving (OPENCHANNEL, Alice, Bob, x, tid) from \mathcal{E}:
2:
          ensure tid hasn't been used for opening another channel before
          ((ph_F, sh_F), (phb_{pay}, shb_{pay}), (phb_{dpay}, shb_{dpay}),
     (phb_{\mathrm{htlc}}, shb_{\mathrm{htlc}}), \mathtt{seed}, (phb_{\mathrm{rev}}, shb_{\mathrm{rev}})) \leftarrow \mathtt{GetKeys}()
          \operatorname{prand}_1 \leftarrow \operatorname{PRF}(\operatorname{seed}, 1)
          (sh_{\text{com},1}, ph_{\text{com},1}) \leftarrow \text{KeyShareGen} (1^k; \text{prand}_1)
6:
          choose unique temporary ID tid // unique for the two parties
7:
          associate keys with tid
          \mathrm{add}\,\left(Alice, Bob, x, \mathtt{tid}, \left(ph_F, sh_F\right), \left(phb_{\mathrm{pay}}, shb_{\mathrm{pay}}\right), \left(phb_{\mathrm{dpay}}, shb_{\mathrm{dpay}}\right)\right)
     (phb_{\mathrm{htlc}}, shb_{\mathrm{htlc}}), (phb_{\mathrm{com},1}, shb_{\mathrm{com},1}), (phb_{\mathrm{rev}}, shb_{\mathrm{rev}}), tid) to pendingOpen
          send (OPENCHANNEL, x, delay, relayDelay, ph_F, phb_{pay}, phb_{dpay}, phb_{htlc},
    ph_{\text{com},1}, phb_{\text{rev}}, tid) to Bob
```

Fig. 2.

```
Protocol $\Pi_{\text{LN}}$ - OPENCHANNEL from $Bob$

1: Upon receiving (OPENCHANNEL, $x$, BobDelay, $pt_F, ptb_{\text{pay}}, ptb_{\text{dpay}}, ptb_{\text{htlc}}, ptc_{\text{com},1}, ptb_{\text{rev}}, tid) from $Bob$:

2: ensure $tid$ has not been used yet with $Bob$

3: $\left((ph_F, sh_F), (phb_{\text{pay}}, shb_{\text{pay}}), (phb_{\text{dpay}}, shb_{\text{dpay}}), (phb_{\text{htlc}}, shb_{\text{htlc}}), \text{seed}, $\left(phb_{\text{rev}}, shb_{\text{rev}}\right) \left\times \text{GetKeys}(\right)$

4: $\text{prand}_1 \left\times \text{PRF} (\text{seed}, 1)$

5: $\left(sh_{\text{com},1}, ph_{\text{com},1}\right) \left\times \text{KeyShareGen} \left(1^k; \text{prand}_1\right)$

6: associate keys with $tid$ and store in pendingOpen

7: $\text{send} \left(\text{ACCEPTCHANNEL}, \text{delay}, \text{relayDelay}, $phb_{\text{pay}}, phb_{\text{dpay}}, phb_{\text{htlc}}, $ph_{\text{com},1}, phb_{\text{rev}}, $tid$) to $Bob$
```

Fig. 3.

```
Protocol \Pi_{\mathrm{LN}} - Accept Channel
 1: Upon receiving (ACCEPTCHANNEL, remoteDelay, pt_F, ptb_{pay}, ptb_{dpay}, ptb_{htlc},
     pt_{\text{com},1}, ptb_{\text{rev}}, \ tid) from Bob:
         ensure there is a temporary ID tid with Bob in pendingOpen on which
     ACCEPTCHANNEL hasn't been received
 3:
         associate received keys with tid
         send (READ) to \mathcal{G}_{Ledger} and assign reply to \Sigma_{Alice}
 4:
         assign to prevout a transaction output found in \Sigma_{Alice} that is currently
     exclusively spendable by Alice and has value y \ge x
         F \leftarrow TX {input spends prevout with a signature(TX, sk_{Alice}), output 0
     pays y - x to pk_{Alice}, output 1 pays x to tid.ph_F \wedge pt_F
 7:
         pchid \leftarrow \mathcal{H}(F)
         replace tid with pchid in storage
         pt_{\text{rev},1} \leftarrow \texttt{CombinePubKey}\left(ptb_{\text{rev}}, ph_{\text{com},1}\right)
         ph_{	ext{dpay},1} \leftarrow 	ext{PubKeyGen}\left(phb_{	ext{dpay}}, ph_{	ext{com},1}\right)
         ph_{\text{pay},1} \leftarrow \texttt{PubKeyGen}\left(phb_{\text{pay}}, ph_{\text{com},1}\right)
11:
12:
         remoteCom \leftarrow remoteCom_1 \leftarrow TX \{input: output 1 of F, output: \}
     (x, ph_{\text{pay},1})
13:
         localCom \leftarrow TX \{ input: output 1 of F, output: \}
     (x, pt_{rev,1} \lor (ph_{dpay_1}, remoteDelay + k + 1 relative))
14:
         add remoteCom and localCom to channel entry in pendingOpen
15:
         sig \leftarrow signature (remoteCom_1, sh_F)
16:
          \texttt{lastRemoteSigned} \leftarrow 0
17:
         send (FUNDINGCREATED, tid, pchid, sig) to Bob
```

Fig. 4.

```
Protocol \Pi_{\mathrm{LN}} - fundingCreated
 1: Upon receiving (FUNDINGCREATED, tid, pchid, BobSig<sub>1</sub>) from Bob:
 2:
          ensure there is a temporary ID tid with Bob in pendingOpen on which we
     have sent up to ACCEPTCHANNEL
          ph_{\text{rev},1} \leftarrow \texttt{CombinePubKey}\left(phb_{\text{rev}}pt_{\text{com},1}\right)
          pt_{\text{dpay},1} \leftarrow \texttt{PubKeyGen}\left(ptb_{\text{dpay}}, pt_{\text{com},1}\right)
          pt_{\text{pay},1} \leftarrow \texttt{PubKeyGen}\left(ptb_{\text{pay}}, pt_{\text{com},1}\right)
 5:
 6:
          \texttt{localCom} \leftarrow \texttt{localCom}_1 \leftarrow \texttt{TX} \; \{ \texttt{input: output 1 of } F, \, \texttt{output: } (x, pt_{\texttt{pay}, 1}) \}
 7:
          \text{ensure } \mathtt{verify} \left( \mathtt{localCom}_1, \mathtt{BobSig}_1, pt_F \right) = \mathtt{True}
          remoteCom \leftarrow remoteCom_1 \leftarrow TX \{input: output 1 of F, output: \}
     (x, ph_{rev} \lor (pt_{dpay}, delay + k + 1 relative))
 9:
          add BobSig, remoteCom1 and localCom1 to channel entry in pendingOpen
10:
          sig \leftarrow signature (remoteCom_1, sh_F)
          mark channel as "broadcast, no fundingLocked"
11:
12:
          lastRemoteSigned, lastLocalSigned \leftarrow 0
13:
          send (FUNDINGSIGNED, pchid, sig) to Bob
```

Fig. 5.

```
Protocol \varPi_{\mathrm{LN}} - \mathtt{FUNDINGSIGNED}
1: Upon receiving (FUNDINGSIGNED, pchid, BobSig<sub>1</sub>) from Bob:
       ensure there is a channel ID pchid with Bob in pendingOpen on which we
   have sent up to fundingCreated
       ensure verify (localCom, BobSig<sub>1</sub>, pb_F) = True
       \texttt{localCom}_1 \leftarrow \texttt{localCom}
       \texttt{lastLocalSigned} \leftarrow 0
5:
6:
       add BobSig_1 to channel entry in pendingOpen
7:
       sig \leftarrow signature(F, sk_{Alice})
8:
       mark pchid in pendingOpen as "broadcast, no FUNDINGLOCKED"
9:
       send (SUBMIT, (sig, F)) to \mathcal{G}_{Ledger}
```

Fig. 6.

```
Protocol \Pi_{\mathrm{LN}} - CheckNew
 1: explicitly add keys et al to channel
 2: Upon receiving (CHECKNEW, Alice, Bob, x, tid) from \mathcal{E}: // new message:
    represents lnd polling daemon
        ensure there is a matching channel in pendingOpen with id pchid with a
    "broadcast" mark
        send (READ) to \mathcal{G}_{\text{Ledger}} and assign reply to \Sigma_{Alice}
        ensure \exists unspent TX in \Sigma_{Alice} with ID pchid and a (x, ph_F \wedge pt_F) output
 5:
        \operatorname{prand}_2 \leftarrow \operatorname{PRF}\left(\operatorname{seed},2\right)
 6:
        (sh_{\text{com},2}, ph_{\text{com},2}) \leftarrow \text{KeyShareGen} (1^k; \text{prand}_2)
 7:
 8:
        add TX to channel data
        replace "broadcast" mark in channel with "in state"
9:
10:
        if channel is marked as "in state, FUNDINGLOCKED" then
             move channel data from pendingOpen to channels
11:
12:
             add receipt of channel to newChannels
13:
14:
         send (FundingLocked, pchid, ph_{com,2}) to Bob
```

Fig. 7.

#### Protocol $\Pi_{\mathrm{LN}}$ - fundingLocked 1: Upon receiving (FUNDINGLOCKED, pchid, $pt_{com,2}$ ) from Bob: ensure there is a channel with ID pchid with Bob in pendingOpen with a "no fundingLocked" mark ensure $pk\left(st_{\text{com},n}\right) = pt_{\text{com},n}$ replace "no fundingLocked" mark in channel with "fundingLocked" 4: ensure channel has an "in state" mark 5: 6: generate 2nd remote delayed payment, htlc, payment keys add TX to channel data 7: move channel data from ${\tt pendingOpen}$ to ${\tt channels}$ 8: add receipt of channel to newChannels

Fig. 8.

```
Protocol \Pi_{\mathrm{LN}} - poll
 1: Upon receiving (POLL) from \mathcal{E}:
 2:
         send (READ) to \mathcal{G}_{\text{Ledger}} and assign reply to \Sigma_{Alice}
         assign largest block number in \Sigma_{Alice} to lastPoll
 3:
         \mathtt{toSubmit} \leftarrow \emptyset
 4:
         for all \tau \in \mathtt{unclaimedOfferedHTLCs} do
 5:
 6:
             if input of \tau has been spent then // by remote HTLC-success
 7:
                 remove \tau from unclaimedOfferedHTLCs
 8:
                 remember preimage - hash combination
 9:
             else if input of \tau has not been spent and timelock is over then
10:
                 remove \ 	au \ from \ unclaimedOfferedHTLCs
                 add \tau to toSubmit
11:
12:
             end if
13:
         end for
         for all remoteCom<sub>n</sub> \in \Sigma_{Alice} that spend F of a channel \in channels do
14:
15:
             if we do not have sh_{rev,n} then // Honest closure
                 for all received HTLC outputs i of \mathtt{remoteCom}_n do
16:
                      if we know the preimage R then
17:
18:
                          TX \leftarrow \{\text{input: } i \text{ HTLC output of } remoteCom_n \text{ with } \}
     (ph_{\text{htlc},n}, R) as method, output: pk_{Alice}
19:
                          sig \leftarrow signature(TX, sh_{htlc,n})
20:
                          add (sig, TX) to toSubmit
21:
                      else
22:
                          add (channel, remoteCom<sub>n</sub>, h, sh_{\text{htlc},n}) to
     {\tt unclaimedReceivedHTLCs}
23:
                      end if
24:
                 end for
25:
                 for all unspent offered HTLC outputs i of remoteCom<sub>n</sub> do
                      TX \leftarrow \{\text{input: } i \text{ HTLC output of } \text{remoteCom}_n \text{ with } ph_{\text{htlc},n} \text{ as } \}
    method, output: pk_{Alice}
27:
                      sig \leftarrow signature(TX, sh_{htlc,n})
28:
                      if timelock has not expired then
29:
                          add (sig, TX) to unclaimedOfferedHTLCs
30:
                      else if timelock has expired then
31:
                          add (sig, TX) to toSubmit
                      end if
32:
33:
                 end for
34:
             else // malicious closure
35:
                 rev \leftarrow TX {inputs: all remoteCom<sub>n</sub> outputs, choosing ph_{rev,n}
     method, output: pk_{Alice}
                 \operatorname{sig} \leftarrow \operatorname{\mathtt{signature}} (\operatorname{rev}, sh_{\operatorname{rev},n})
36:
                 add (sig, rev) to toSubmit
37:
38:
             end if
39:
             move channel from channels to closedChannels
40:
         end for
41:
         send (SUBMIT, toSubmit) to \mathcal{G}_{\text{Ledger}}
42:
43: Upon receiving (GETNEW) from Alice:
         clear newChannels(Alice), closedChannels(Alice), pendingUpdates(Alice)
    and send them to Alice
```

```
Protocol \Pi_{\mathrm{LN}} - invoice
 1: Upon receiving (PAY, Bob, x, \overrightarrow{path}, receipt) from \mathcal{E}:
 2:
        ensure that path consists of valid pchids
        ensure that the first pchid \in \overrightarrow{path} has the same pchid as in receipt
 3:
        ensure that receipt corresponds to the latest version of an open
    channel \in channels in which we have at least x.
        choose unique payment ID payid // unique for Alice and Bob
 5:
        add (Bob, x, path, receipt, payid, "waiting for invoice") to pendingPay
 6:
 7:
        send (SENDINVOICE, payid) to Bob
 8:
 9: Upon receiving (SENDINVOICE, payid) from Bob:
10:
        ensure there is no (Bob, payid) entry in pendingGetPaid
11:
        choose random, unique preimage R
12:
        add (Bob, R, payid) to pendingGetPaid
13:
        send (INVOICE, \mathcal{H}(R), payid) to Bob
14:
15: Upon receiving (INVOICE, h, payid) from Bob:
        ensure there is a (Bob, x, path, receipt, payid, "waiting for invoice") entry
    in pendingPay
        ensure h is valid (in the range of \mathcal{H})
17:
18:
        remove entry from pendingPay
19:
        send (READ) to \mathcal{G}_{\text{Ledger}} and assign largest block number to t
        m \leftarrow the concatenation of length path (x, remoteDelay_i) pairs, where the
    last remoteDelay is t + 2k + 1 + BobDelay and every previous remoteDelay is
    incremented by 3k + RHSDelay Alice doesn't know these Bob, RHS delays
21:
        (\mu_0, \delta_0) \leftarrow \text{SphinxCreate} (m, \text{ public keys of } \overrightarrow{\text{path}} \text{ parties})
22:
        let remoteCom_n the latest signed remote commitment tx
23:
        reduce simple payment output in remoteCom by x
        add an additional (x, ph_{\text{rev},n+1} \lor (ph_{\text{htlc},n+1} \land pt_{\text{htlc},n+1}, \text{ on preimage})
     of h) \vee ph_{\mathrm{htlc},n+1}, largest remoteRelayDelay absolute) output (all with n+1
    keys) to remoteCom, marked with HTLCNo
25:
        increment \mathtt{HTLCNo}_{pchid} by one and associate x, h, pchid with it
26:
        mark HTLCNo as "sender"
        send (UPDATEADDHTLC, first pchid of path, HTLCNo<sub>pchid</sub>, x, h, largest
27:
    remoteDelay, (\mu_0, \delta_0)) to pchid channel counterparty
```

Fig. 10.

```
Protocol \Pi_{\mathrm{LN}} - updateAddHtlc
 1: Upon receiving (UPDATEADDHTLC, pchid, HTLCNo, x, h, remoteDelay, M) from
    Bob:
 2:
        ensure pchid corresponds to an open channel in channels where Bob has
    at least x
        ensure \mathtt{HTLCNo} = \mathtt{HTLCNo}_{pchid} + 1
 3:
        (pchid', x', \texttt{remoteDelay}', \delta) \leftarrow \texttt{SphinxPeel}(sk_{Alice}, M)
 5:
        if \delta = \text{receiver then}
            ensure
    pchid' = \bot, x = x', \texttt{remoteDelay} = \texttt{remoteDelay}' = 2k + 1 + \texttt{delay}
 7:
            increment \mathtt{HTLCNo}_{pchid} by one
            mark HTLCNo as "receiver"
 8:
9:
        else// We are an intermediary
10:
            ensure x = x', remoteDelay = remoteDelay' + 3k + delay
            ensure pchid' corresponds to an open channel in channels where we
11:
    have at least x
12:
            increment \mathtt{HTLCNo}_{pchid} by one
            mark HTLCNo as "intermediary"
13:
14:
         end if
15:
        let remoteCom_n the latest signed remote commitment tx
16:
        reduce delayed payment output in remoteCom by x
17:

```

Fig. 17.

#### 4 Transaction Structure

A well-formed transaction contains:

- A list of inputs
- A list of outputs
- An arbitrary payload (optional)

Each input must be connected to a single valid, previously unconnected (unspent) output in the state.

We assume a one-way, collision-free hash function  $\mathcal H$  that creates the id of each transaction.

A well-formed output contains:

- A value in coins
- A list of spending methods. An input that spends this output must specify exactly one of the available spending methods.

A well-formed spending method contains any combination of the following:

- Public keys in disjunctive normal form. An input that spends using this spending method must contain signatures made with the private keys that correspond to the public keys of one of the conjunctions. If empty, no signatures are needed.
- Absolute locktime in block height, transaction height or time. The output can be spent by an input to a transaction that is added to the state after the specified block height, transaction height or time.

- Relative locktime in block height, transaction height or time. The
  output can be spent by an input that is added to the state after the
  current output has been part of the state for the specified number of
  blocks, transactions or time.
- Hashlock value. The output can be spent by an input that contains a
  preimage that hashes to the hashlock value. If empty, the input does
  not need to specify a preimage.

If both the absolute and the relative locktime are empty, output can be spent immediately after being added to the state.

A well-formed input contains:

- A reference to the output and the spending method it spends
- A set of signatures that correspond to one of the conjunctions of public keys in the referred spending method (if needed)
- A preimage that hashes to the hashlock value of the referred spending method (if needed)

Lastly, the sum of coins of the outputs referenced by the inputs of the transaction (to-be-spent outputs) should be greater than or equal to the sum of coins of the outputs of the transaction.

We say that an unspent output is currently exclusively spendable by a player Alice with a public key pk and a hash list hl if for each spending method one of the following two holds:

- It still has a locktime that has not expired and thus is currently unspendable, or
- The only specified public key is pk and if there is a hashlock, its hash is contained in hl.

If an output is exclusively spendable, we say that its coins are exclusively spendable.

# Functionality $\mathcal{F}_{PavNet}$ - support Parameters: - one-way, collision-free hash function $\mathcal{H}$ (for generating transaction IDs) Interface (messages from $\mathcal{E}$ ): check - (register) - (SETDELAY, delay) - (OPENCHANNEL, self, peer, selfCoins) - (CLOSECHANNEL, receipt) (PAY, peer, coins, path, receipt) Initialisation: 1: Initialisation: $\texttt{channels}, \texttt{pendingPay}, \texttt{pendingOpen}, \texttt{corrupted} \leftarrow \emptyset$ 2: 3: 4: Upon receiving (REGISTER, delay, relayDelay) from Alice: $\mathtt{delay}\left(Alice\right) \leftarrow \mathtt{delay}$ 5: $relayDelay(Alice) \leftarrow relayDelay$ 6: 7: pendingUpdates (Alice), newChannels $(Alice) \leftarrow \emptyset$ $negligent(Alice), relayNegligent(Alice) \leftarrow \emptyset$ send (READ) to $\mathcal{G}_{Ledger}$ as Alice and assign largest block number to lastPoll(Alice) send (REGISTER, Alice, delay, relayDelay, lastPoll) to $\mathcal S$ 10: 11: 12: Upon receiving (REGISTERDONE, Alice, pubKey) from S: $pubKey(Alice) \leftarrow pubKey$ 13: 14: send (REGISTER, Alice, delay, relayDelay, pubKey) to Alice 15: 16: Upon receiving (REGISTERED) from Alice: send (READ) to $\mathcal{G}_{Ledger}$ as Alice and assign reply to $\Sigma_{Alice}$ 17: assign the sum of all output values that are exclusively spendable by Alice to onChainBalance 19: send (REGISTERED) to Alice 20: 21: Upon receiving any message except for (REGISTER) from Alice: 22: ignore message if Alice has not registered 23: 24: Upon receiving (CORRUPTED, Alice) from S: 25: add Alice to corrupted 26: 27: At the end of each activation: [Orfeas: can this part completely go?] verify on Chainbalance() for all parties is consistent with ledger (if not roll back the state and ignore command of activation).

        send (READ) to \mathcal{G}_{\text{Ledger}} as Alice and assign reply to \Sigma_{\text{Alice}}
24:
        \mathbf{for} \ \mathbf{all} \ \mathbf{channel} \in \mathtt{details} \ \mathbf{do}
25:
            ensure channel \in toReport (Alice)
26:
            if channel is marked as "malicious" then
27:
               ensure that transactions that spend the funding tx of channel and
    pay Alice the entire channel value exist in \Sigma_{Alice}
28:
            else // channel is marked as "honest'
29:
               ensure that transactions that spend the funding tx of channel and
    pay Alice the her part in channel exist in \Sigma_{Alice}
30:
               ensure that Alice has not suffered losses for multi-hop payments
    where she was not the payer
31:
32:
            add the receipt of channel to closedChannels(Alice)
33:
            remove channel from channels and toReport(Alice)
34:
        end for
35:
36: Upon receiving (GETNEW) from Alice:
        clear newChannels(Alice), closedChannels(Alice), pendingUpdates(Alice)
    and send them to Alice
```

## Functionality $\mathcal{F}_{\mathrm{PayNet,dummy}}$

- 1: Upon receiving any message M from Alice: send (M, Alice) to S
- 2: Upon receiving any message (M, Alice) from S: send M to Alice

Fig. 23.

#### Simulator $\mathcal{S}_{\mathrm{LN}}$

Expects the same messages as the protocol, but messages that the protocol expects to receive from  $\mathcal{E}$ , the simulator expects to receive from  $\mathcal{F}_{\text{PayNet,dummy}}$  with the name of the player appended. The simulator internally executes one copy of the protocol per player. Upon receiving any message, the simulator runs the relevant code of the protocol copy tied to the appended player name. Mimicking the real-world case, if a protocol copy sends a message to another player, that message is passed to  $\mathcal{A}$  as if sent by the player and if  $\mathcal{A}$  allows the message to reach the receiver, then the simulator reacts by acting upon the message with the protocol copy corresponding to the recipient player. A message sent by a protocol copy to  $\mathcal{E}$  will be routed by  $\mathcal{S}$  to  $\mathcal{F}_{\text{PayNet,dummy}}$  instead. To distinguish which player it comes from,  $\mathcal{S}$  also appends the player name to the message.

Fig. 24.

$$\textbf{Lemma 1. } \text{Exec}^{\mathcal{G}_{\text{Ledger}}}_{\mathit{\Pi}_{\text{LN}},\mathcal{A}_{\text{d}},\mathcal{E}} = \text{Exec}^{\mathcal{F}_{\text{PayNet,dummy}},\mathcal{G}_{\text{Ledger}}}_{\mathcal{S}_{\text{LN}},\mathcal{E}}$$

*Proof.* Consider a message that  $\mathcal{E}$  sends. In the real world, the protocol ITIs produce an output. In the ideal world, the message is given to  $\mathcal{S}_{LN}$  through  $\mathcal{F}_{PayNet,dummy}$ . The former simulates the protocol ITIs of the real world (along with their coin flips) and so produces an output from the exact same distribution, which is given to  $\mathcal{E}$  through  $\mathcal{F}_{PayNet,dummy}$ . Thus the two outputs are indistinguishable.

$$\textbf{Lemma 2. } \text{Exec}_{\mathcal{S}_{\text{LN}},\mathcal{E}}^{\mathcal{F}_{\text{PayNet,dummy}},\mathcal{G}_{\text{Ledger}}} = \text{Exec}_{\mathcal{S}_{\text{LN-Reg}},\mathcal{E}}^{\mathcal{F}_{\text{PayNet,dummy+Reg}},\mathcal{G}_{\text{Ledger}}}$$

*Proof.* When  $\mathcal{E}$  sends (REGISTER, delay, relayDelay) to *Alice*, it receives as a response (REGISTER, *Alice*, delay, relayDelay,  $pk_{Alice}$ ) where  $pk_{Alice}$  is a public key generated by KeyGen() both in the real (c.f. Fig. 1, line 10) and in the ideal world (c.f. Fig. 26, line 5).

# Functionality $\mathcal{F}_{\mathrm{PayNet,dummy+Reg}}$

- 1: For messages register, registerDone and registered, act like  $\mathcal{F}_{PayNet}$ .
- 2: Upon receiving any other message M from Alice: send (M, Alice) to S
- 3: Upon receiving any other message (M, Alice) from S: send M to Alice

Fig. 25.

# Simulator $\mathcal{S}_{\mathrm{LN-Reg}}$

Like  $S_{LN}$ , but it does not accept (REGISTERED) from  $\mathcal{F}_{PayNet,dummy+Reg}$ . Additional differences:

- 1: Upon receiving (REGISTER, Alice, delay, relayDelay, lastPoll) from FPayNet,dummy+Reg:
- 2: delay of Alice ITI  $\leftarrow$  delay
- 3: relayDelay of *Alice* ITI ← relayDelay
- 4: lastPoll of  $Alice ITI \leftarrow lastPoll$
- 5:  $(pk_{Alice}, sk_{Alice})$  of  $Alice ITI \leftarrow KeyGen()$
- 6: send (REGISTERDONE, Alice,  $pk_{Alice}$ ) to  $\mathcal{F}_{PayNet,dummy+Reg}$

Fig. 26.

Furthermore, one (READ) is sent to  $\mathcal{G}_{Ledger}$  from *Alice* in both cases (Fig. 1, line 9 and Fig. 18, line 9).

Additionally,  $S_{\text{LN-Reg}}$  ensures that the state of Alice ITI is exactly the same as what would have been in the case of  $S_{\text{LN}}$ , as lines 7-10 of Fig. 1 change the state of Alice ITI in the same way as lines 2-5 of Fig. 26.

Lastly, the fact that the state of the *Alice* ITIs are changed in the same way in both worlds, along with the same argument as in the proof of Lemma 1 ensures that the rest of the messages are responded in an indistinguishable way in both worlds.  $\Box$ 

### 5 Combined Sign primitive

#### 5.1 Algorithms

- $-(mpk, msk) \leftarrow \text{MasterKeyGen}\left(1^k\right)$
- $-(pk, sk) \leftarrow \text{KeyShareGen}\left(1^k\right)$
- $-(cpk_l, csk_l) \leftarrow \text{CombineKey}(msk, mpk, sk, pk)$
- $-cpk_l$  ← CombinePubKey (mpk, pk)
- $-\sigma \leftarrow \text{Sign}\left(csk, m\right)$
- $-\{0,1\} \leftarrow \text{Verify}(cpk, m, \sigma)$

#### 5.2 Correctness

```
 \begin{array}{l} - \ \forall k \in \mathcal{N}, \\ \Pr[(mpk, msk) \leftarrow \operatorname{MasterKeyGen}\left(1^k\right), \\ (pk, sk) \leftarrow \operatorname{KeyShareGen}\left(1^k\right), \\ (cpk_1, csk_1) \leftarrow \operatorname{CombineKey}\left(msk, mpk, sk, pk\right), \\ cpk_2 \leftarrow \operatorname{CombinePubKey}\left(mpk, pk\right), \\ cpk_1 = cpk_2] = 1 \\ - \ \forall k \in \mathcal{N}, m \in \mathcal{M}, \\ \Pr[(mpk, msk) \leftarrow \operatorname{MasterKeyGen}\left(1^k\right), \\ (pk, sk) \leftarrow \operatorname{KeyShareGen}\left(1^k\right), \\ (cpk, csk) \leftarrow \operatorname{CombineKey}\left(mpk, msk, pk, sk\right), \\ \operatorname{Verify}(cpk, m, \operatorname{Sign}(csk, m)) = 1] = 1 \end{array}
```

### 5.3 Security

```
Game share-EUF^{\mathcal{A}} (1^k)

1: (\mathtt{aux}, mpk, n) \leftarrow \mathcal{A} (INIT)

2: for i \leftarrow 1 to n do

3: (pk_i, sk_i) \leftarrow \mathsf{KEYSHAREGEN} (1^k)

4: end for

5: (cpk^*, pk^*, m^*, \sigma^*) \leftarrow \mathcal{A} (KEYS, \mathtt{aux}, pk_1, \ldots, pk_n)

6: if pk^* \in \{pk_1, \ldots, pk_n\} \land cpk^* = \mathsf{COMBINEPUBKEY} (mpk, pk^*) \land \mathsf{VERIFY} (cpk^*, m^*, \sigma^*) = 1 then

7: return 1

8: else

9: return 0

10: end if
```

Fig. 27.

**Definition 1.** A Combined Sign scheme is share-EUF-secure if

$$\forall k \in \mathbb{N}, \forall \mathcal{A} \in \mathtt{PPT}, \Pr\left[\mathsf{share}\text{-}\mathsf{EUF}^{\mathcal{A}}\left(1^{k}\right) = 1\right] < negl\left(k\right)$$

```
Game master-EUF-CMA^{\mathcal{A}} (1^k
 1: (mpk, msk) \leftarrow \text{MasterKeyGen}(1^k)
 3: (aux_i, response) \leftarrow \mathcal{A}(INIT, mpk)
 4: while response can be parsed as (pk, sk, m) do
 6:
          store pk, sk, m as pk_i, sk_i, m_i
 7:
          (cpk_i, csk_i) \leftarrow \text{CombineKey}(mpk, msk, pk_i, sk_i)
          \sigma_i \leftarrow \text{Sign}\left(csk_i, m_i\right)
          (\mathtt{aux}_i, \mathtt{response}) \leftarrow \mathcal{A}(\mathtt{SIGNATURE}, \mathtt{aux}_{i-1}, \sigma_i)
10: end while
11: parse response as (cpk^*, pk^*, m^*, \sigma^*)
12: if m^* \notin \{m_1, \dots, m_i\} \land cpk^* = \text{CombinePubKey}(mpk, pk^*) \land
     VERIFY (cpk^*, m^*, \sigma^*) = 1 then
          return 1
13:
14: else
15:
          return 0
16: end if
```

Fig. 28.

**Definition 2.** A Combined Sign scheme is master-EUF-CMA-secure if

$$\forall k \in \mathbb{N}, \forall \mathcal{A} \in \mathtt{PPT}, \Pr\left[\mathsf{master-EUF-CMA}^{\mathcal{A}}\left(1^{k}\right) = 1\right] < negl\left(k\right)$$

**Definition 3.** A Combined Sign scheme is combine-EUF-secure if it is both share-EUF-secure and master-EUF-CMA-secure.

### 5.4 Construction

```
output standard signing keypairs to avoid duplication? Parameters: \mathcal{H}, G

like standard verify

end function

just to remember

sh_{rev,n} \leftarrow shb_{rev} \cdot \mathcal{H}(phb_{rev}||pt_{com,n}) + st_{com,n} \cdot \mathcal{H}(pt_{com,n}||phb_{rev})

pt_{rev,n+2} \leftarrow ptb_{rev} \cdot \mathcal{H}(ptb_{rev}||ph_{com,n+2}) + ph_{com,n+2} \cdot \mathcal{H}(phc_{com,n+2}||ptb_{rev})

ph_{rev,n+2} \leftarrow phb_{rev} \cdot \mathcal{H}(phb_{rev}||pt_{com,n+2}) + pt_{com,n+2} \cdot \mathcal{H}(pt_{com,n+2}||phb_{rev})
```

**Lemma 3.** The construction above is share-EUF-secure in the Random Oracle model under the assumption that the underlying signature scheme is strongly EUF-CMA-secure and the range of the Random Oracle coincides with that of the underlying signature scheme signing keys.

*Proof.* Let  $k \in \mathbb{N}, \mathcal{B}$  PPT algorithm such that

$$\Pr\left[\mathsf{share}\text{-}\mathsf{EUF}^{\mathcal{B}}\left(1^{k}\right)=1\right]=a>\operatorname{negl}\left(k\right)$$
 .

We construct a PPT distinguisher  $\mathcal{A}$  (Fig. 29) such that

$$\Pr\left[\mathsf{EUF\text{-}CMA}^{\mathcal{A}}\left(1^{k}\right)=1\right]>\operatorname{negl}\left(k\right)$$

that breaks the assumption, thus proving Lemma 3.

```
Algorithm \mathcal{A}\left(vk\right)
 1: j \stackrel{\$}{\leftarrow} U[1, T(\mathcal{B})] // T(M) is the maximum running time of M
          Random Oracle: for every first-seen query q from \mathcal{B} set \mathcal{H}(q) to a random
          return \mathcal{H}(q) to \mathcal{B}
 4: (aux, mpk, n) \leftarrow \mathcal{A}(INIT)
 5: for i \leftarrow 1 to n do
          (pk_i, sk_i) \leftarrow \text{KeyShareGen}(1^k)
 7: end for
          Random Oracle: Let q be the jth first-seen query from \mathcal{B}:
 9:
          if q = (mpk \parallel x) then
               if \mathcal{H}(x \parallel mpk) unset then
                    set \mathcal{H}(x || mpk) to a random value
11:
12:
               set \mathcal{H}(mpk \parallel x) to (vk - x \cdot \mathcal{H}(x \parallel mpk)) \cdot mpk^{-1}
13:
14:
          else if q = (x \parallel mpk) then
               if \mathcal{H}(mpk \parallel x) unset then
15:
16:
                    set \mathcal{H}(mpk || x) to a random value
17:
               set \mathcal{H}(x \parallel mpk) to (vk - mpk \cdot \mathcal{H}(mpk \parallel x)) \cdot x^{-1}
18:
19:
          else
20:
               set \mathcal{H}(q) to a random value
21:
          end if
22:
          return \mathcal{H}(q) to \mathcal{B}
23: (cpk^*, pk^*, m^*, \sigma^*) \leftarrow \mathcal{B}(\text{KEYS}, \text{aux}, pk_1, \dots, pk_n)
24: if vk = cpk^* \wedge \mathcal{B} wins the share-EUF game then //\mathcal{A} won the EUF-CMA game
25:
          return (m^*, \sigma^*)
26: else
27:
          return FAIL
28: end if
```

Fig. 29.

Let Y be the range of the random oracle. The modified random oracle used in Fig. 29 is indistinguishable from the standard random oracle by PPT algorithms since the statistical distance of the standard random oracle from the modified one is at most  $\frac{1}{2|Y|} < negl(k)$  as they differ in at most one element.

Let E denote the event in which  $\mathcal{B}$  does not invoke CombinePubKey to produce  $cpk^*$ . In that case the values  $\mathcal{H}(pk^* \parallel mpk)$  and  $\mathcal{H}(mpk \parallel pk^*)$ 

are decided after  $\mathcal{B}$  terminates (Fig. 29, line 24) and thus

$$\Pr\left[cpk^* = \text{CombinePubKey}\left(mpk, pk^*\right) | E\right] = \frac{1}{|Y|} < negl\left(k\right) \Rightarrow$$

$$\Pr\left[cpk^* = \text{CombinePubKey}\left(mpk, pk^*\right) \land E\right] < negl\left(k\right) .$$
(1)

It is

$$(\mathcal{B} \text{ wins}) \to (cpk^* = \text{CombinePubKey} (mpk, pk^*)) \Rightarrow$$

$$\Pr\left[\mathcal{B} \text{ wins}\right] \leq \Pr\left[cpk^* = \text{CombinePubKey} (mpk, pk^*)\right] \Rightarrow$$

$$\Pr\left[\mathcal{B} \text{ wins} \land E\right] \leq \Pr\left[cpk^* = \text{CombinePubKey} (mpk, pk^*) \land E\right] \stackrel{(1)}{\Rightarrow}$$

$$\Pr\left[\mathcal{B} \text{ wins} \land E\right] < negl\left(k\right) .$$

But we know that  $\Pr[\mathcal{B} \text{ wins}] = \Pr[\mathcal{B} \text{ wins} \wedge E] + \Pr[\mathcal{B} \text{ wins} \wedge \neg E]$ and  $\Pr[\mathcal{B} \text{ wins}] = a$  by the assumption, thus

$$\Pr\left[\mathcal{B} \text{ wins } \wedge \neg E\right] > a - negl(k) \quad . \tag{2}$$

We now focus at the event  $\neg E$ . Let F the event in which the call of  $\mathcal{B}$  to CombinePubKey to produce  $cpk^*$  results in the jth invocation of the Random Oracle. Since j is chosen uniformly at random,  $\Pr[F|\neg E] = \frac{1}{T(\mathcal{B})}$ . Observe that  $\Pr[F|E] = 0 \Rightarrow \Pr[F] = \Pr[F|\neg E] = \frac{1}{T(\mathcal{B})}$ .

In the case where the event  $(F \wedge \mathcal{B} \text{ wins } \land \neg E)$  holds, it is

$$cpk^* = \text{CombinePubKey}(mpk, pk^*) = mpk \cdot \mathcal{H}(mpk \parallel pk^*) + pk^* \cdot \mathcal{H}(pk^* \parallel mpk)$$

Since F holds, the jth invocation of the Random Oracle queried either  $\mathcal{H}(mpk \parallel pk^*)$  or  $\mathcal{H}(pk^* \parallel mpk)$ . In either case (Fig. 29, lines 9-18), it is  $cpk^* = vk$ . This means that VERIFY  $(vk, m^*, \sigma^*) = 1$ . We conclude that in the event  $(F \wedge \mathcal{B} \text{ wins } \wedge \neg E)$ ,  $\mathcal{A}$  wins the EUF-CMA game. A final observation is that the probability that the events  $(\mathcal{B} \text{ wins } \wedge \neg E)$  and F are almost independent, thus

$$\Pr[F \land \mathcal{B} \text{ wins } \land \neg E] = \Pr[F] \Pr[\mathcal{B} \text{ wins } \land \neg E] \pm negl(k) \stackrel{(2)}{=}$$
$$\frac{a - negl(k)}{T(\mathcal{B})} \pm negl(k) > negl(k)$$

**Lemma 4.** The construction above is master-EUF-CMA-secure in the Random Oracle model under the assumption that the underlying signature scheme is strongly EUF-CMA-secure and the range of the Random Oracle coincides with that of the underlying signature scheme signing keys.

*Proof.* Let  $k \in \mathbb{N}, \mathcal{B}$  PPT algorithm such that

$$\Pr\left[\mathsf{master}\text{-}\mathsf{EUF}\text{-}\mathsf{CMA}^{\mathcal{B}}\left(1^{k}\right)=1\right]=a>\operatorname{negl}\left(k\right)\ .$$

We construct a PPT distinguisher  $\mathcal{A}$  (Fig. 30) such that

$$\Pr\left[\mathsf{EUF\text{-}CMA}^{\mathcal{A}}\left(1^{k}\right)=1\right]>\operatorname{negl}\left(k\right)$$

that breaks the assumption, thus proving Lemma 4.

```
Algorithm \mathcal{A}(vk)
 1: j \stackrel{\$}{\leftarrow} U[1, T(\mathcal{B}) + T(\mathcal{A})] // T(M) is the maximum running time of M
 2:
          Random Oracle: for every first-seen query q from \mathcal{B} set \mathcal{H}(q) to a random
          return \mathcal{H}(q) to \mathcal{B}
 3:
 4: (mpk, msk) \leftarrow \text{MasterKeyGen}(1^k)
          Random Oracle: Let q be the jth first-seen query from \mathcal B or \mathcal A:
          if q = (mpk \parallel x) then
 6:
 7:
               if \mathcal{H}(x \parallel mpk) unset then
                    set \mathcal{H}(x \parallel mpk) to a random value
 8:
 9:
               end if
               set \mathcal{H}(mpk \parallel x) to (vk - x \cdot \mathcal{H}(x \parallel mpk)) \cdot mpk^{-1}
10:
          else if q = (x || mpk) then
11:
12:
               if \mathcal{H}(mpk \parallel x) unset then
13:
                    set \mathcal{H}(mpk \parallel x) to a random value
14:
15:
               set \mathcal{H}(x \parallel mpk) to (vk - mpk \cdot \mathcal{H}(mpk \parallel x)) \cdot x^{-1}
16:
17:
               set \mathcal{H}(q) to a random value
18:
          end if
          return \mathcal{H}(q) to \mathcal{B} or \mathcal{A}
19:
20: i \leftarrow 0
21: (aux_i, response) \leftarrow \mathcal{B}(INIT, mpk)
22: while response can be parsed as (pk, sk, m) do
23:
          i \leftarrow i + 1
24:
          store pk, sk, m as pk_i, sk_i, m_i
          (cpk_i, csk_i) \leftarrow \text{CombineKey}(mpk, msk, pk_i, sk_i)
25:
26:
          \sigma_i \leftarrow \text{Sign}\left(csk_i, m_i\right)
27:
          (aux_i, response) \leftarrow \mathcal{B}(SIGNATURE, aux_{i-1}, \sigma_i)
28: end while
29: parse response as (cpk^*, pk^*, m^*, \sigma^*)
30: (cpk^*, pk^*, m^*, \sigma^*) \leftarrow \mathcal{B}(\text{KEYS}, \text{aux}, pk_1, \dots, pk_n)
31: if vk = cpk^* \wedge \mathcal{B} wins the master-EUF-CMA game then //\mathcal{A} won the
     EUF-CMA game
32:
          return (m^*, \sigma^*)
33: else
34:
          return FAIL
35: end if
```

Fig. 30.

The modified random oracle used in Fig. 30 is indistinguishable from the standard random oracle for the same reasons as in the proof of Lemma 3.

Let E denote the event in which CombinePubKey is not invoked to produce  $cpk^*$ . In that case the values  $\mathcal{H}(pk^* \parallel mpk)$  and  $\mathcal{H}(mpk \parallel pk^*)$ are decided after  $\mathcal{B}$  terminates (Fig. 30, line 31) and thus

$$\Pr\left[cpk^* = \text{CombinePubKey}\left(mpk, pk^*\right) | E\right] < negl\left(k\right) \Rightarrow \\ \Pr\left[cpk^* = \text{CombinePubKey}\left(mpk, pk^*\right) \land E\right] < negl\left(k\right) . \end{cases}$$
(3)

We can reason like in the proof of Lemma 3 to deduce that

$$\Pr\left[\mathcal{B} \text{ wins } \wedge \neg E\right] > a - negl\left(k\right) . \tag{4}$$

We now focus at the event  $\neg E$ . Let F the event in which the call of to CombinePubKey that produces  $cpk^*$  results in the jth invocation of the Random Oracle. Since j is chosen uniformly at random,  $\Pr[F|\neg E] =$  $\frac{1}{T(\mathcal{B})+T(\mathcal{A})}$ . Observe that  $\Pr[F|E]=0 \Rightarrow \Pr[F]=\Pr[F|\neg E]=\frac{1}{T(\mathcal{B})+T(\mathcal{A})}$ . Once more we can reason in the same fashion as in the proof of

Lemma 3 to deduce that

$$\Pr[F \land \mathcal{B} \text{ wins } \land \neg E] = \Pr[F] \Pr[\mathcal{B} \text{ wins } \land \neg E] \pm negl(k) \stackrel{(4)}{=} \frac{a - negl(k)}{T(\mathcal{B}) + T(\mathcal{A})} \pm negl(k) > negl(k)$$

**Theorem 1.** The construction above is combine-EUF-secure in the Random Oracle model under the assumption that the underlying signature scheme is strongly EUF-CMA-secure.

*Proof.* The construction is combine-EUF-secure as a direct consequence of Lemma 3, Lemma 4 and the definition of combine-EUF-security.
